Sentinel Experience Architecture (SEA)

Version: 1.0

Status: Draft

Vision

Project Sentinel shall deliver enterprise-grade cybersecurity through a user experience that remains understandable, accessible, and efficient.

Complexity belongs inside the platform—not in front of the user.

Principle 1: Progressive Disclosure

The interface reveals only what is needed for the current task.

- Home users see guided missions.
- Professionals can expand technical details.
- Experts have access to full evidence, object relationships, and workflows.

One platform, different levels of depth.

Principle 2: One-Click Missions

Every common security objective starts with a guided mission.

Examples include:

- Secure My Website.
- Scan My Computer.
- Check My Phone.
- Review Cloud Security.
- Prepare for Compliance Audit.
- Investigate an Alert.

The Mission Orchestrator assembles the necessary engines automatically.

Principle 3: Explain Every Result

Each finding includes:

- A plain-language explanation.
- Technical details.
- Supporting evidence.
- Confidence level.
- Business impact.
- Verification steps.

No unexplained scores or recommendations.

Principle 4: Consistency

Every screen uses the same interaction patterns, terminology, icons, and navigation. Users should not have to relearn the interface when switching between modules.

PS-ADR-0016

User Experience Is a Security Feature

Decision

Ease of use shall be treated as a core security capability rather than a cosmetic concern.

Rationale

Security tools are only effective when users understand their findings and can act on them confidently. A consistent, accessible, mission-driven interface reduces errors and increases adoption.

A realistic long-term ambition

If we execute this blueprint well over several years, I believe Project Sentinel can become a platform that organizations choose **because it is easier to understand, easier to extend, and easier to trust**, while still providing deep technical capabilities.

That is a realistic and differentiated goal. Rather than trying to outperform every existing product in its own specialty, we build a platform that unifies security operations with a coherent architecture, evidence-based reasoning, and an exceptional user experience. That combination is both technically achievable and commercially compelling.

====[USER]====

Good and continue

====[ASSISTANT]====

Excellent. I think we are now at the point where Project Sentinel starts becoming its own category of software.

I would actually stop calling it just a **Cyber Security Operating Platform (CSOP)**.

It is becoming a **Cyber Security Operating Environment (CSOE)**.

There is an important difference.

A platform provides tools.

An operating environment coordinates everything.

That is where we are heading.

PROJECT SENTINEL BLUEPRINT
