

Volume 27

Enterprise Fleet Intelligence Platform (EFIP)

Vision

Instead of thinking about one laptop.

Project Sentinel thinks about

Entire Fleets

A Fleet may contain

- Windows laptops
- Linux servers
- macOS devices
- Android phones
- iPhones
- iPads
- Virtual Machines
- Cloud instances
- Containers

Everything becomes one managed ecosystem.

Fleet Object

Everything belongs somewhere.

Organization

Immediately.

You know

who owns

what.

Fleet Dashboard

Instead of thousands of devices.

The CISO sees

Total Devices

One click

opens the next level.

Department View

Example

Finance Department

Computers

Employee View

Example

John Smith

Laptop

iPhone

VPN

Microsoft 365

GitHub

Certificates

Trust

95%

Mission History

Timeline

Everything connected.

Fleet Mission

Instead of scanning one laptop.

Mission

Verify Entire Company

Parallel Architecture

This is where Project Sentinel becomes powerful.

Imagine

20,000 laptops.

We never scan them sequentially.

Instead

Mission

Workers automatically scale based on available resources and organizational policies.

Distributed Collectors

Instead of one central scanner.

Organizations deploy lightweight Sentinel Collectors.

Example
Head Office

Every collector reports to Sentinel Core.

Smart Scheduling

Scanning does not begin at 09:00 Monday for every device.

Instead

The Scheduler understands

- Time Zones
- Office Hours
- CPU Usage
- Battery Level (for laptops)
- Network Load
- Maintenance Windows

The user barely notices.

Continuous Endpoint Verification

Traditional products scan.

We verify.

Example

Laptop

Morning

↓

Lunch

↓

Evening

↓

Patch Installed

↓

Trust Increased

↓

Timeline Updated

The Digital Twin evolves continuously.

Fleet Heat Map

This will become one of the flagship dashboards.

Example

North America

Then

Country

↓

Office

↓

Floor

↓

Department

↓

Employee

↓

Device

Everything drillable.

Fleet Intelligence

Questions Project Sentinel should answer

Show every laptop

running Windows 11

missing BitLocker

and used by Finance.

Or

Show Android devices

that have not received security updates
for 60 days.

Or

Show every endpoint
whose Trust Score dropped
this week.

This is the power of our object model.

Endpoint Timeline

Every computer
gets a timeline.
Purchased

Years of history.

Mobile Fleet

Exactly the same architecture.
Organization

One interface.

Fleet Health

One of my favorite ideas.

Instead of

Green

Yellow

Red

We display

Security

Compliance

Performance

Identity

Backup

Encryption

Configuration

Updates

Accessibility

Trust

Each has its own score and supporting evidence.

NEW CORE ENGINE

Fleet Intelligence Engine

This engine continuously answers:

Which departments improve?

Which departments decline?

Which devices repeatedly fail verification?

Which teams resolve issues fastest?

Where should the next security investment be made?

NEW CORE ENGINE

Fleet Prediction Engine

Because we already have

History

Knowledge

Trust

Changes

We can identify trends, for example:

- Devices approaching end of support.
- Certificates nearing expiration.
- Security controls with declining adoption.
- Assets that have not been assessed recently.

The engine provides planning insights based on observed data rather than certainty about future events.

NEW CORE ENGINE

Device Relationship Engine

Example

Employee

↓

Laptop

↓

VPN

↓

Microsoft 365

↓

GitHub

↓

AWS

↓

Production

↓

Website

If a laptop is suspected of compromise, the platform immediately shows which connected assets and identities should be reviewed. This supports faster impact assessment without assuming those assets are compromised.

NEW IDEA

Enterprise Security Replay

Imagine.

Yesterday

Everything normal.

Today

A CISO asks

"What changed?"

Project Sentinel answers with a replay:

Yesterday 18:00

This transforms operational reporting into a clear, evidence-backed story.

NEW IDEA

Cyber Command Center

I think this becomes the "**wow factor**" for enterprises.

Not dozens of dashboards.

One operational screen.

Organization Trust

Everything is drill-down.

Everything is connected.

Your earlier requirement is now becoming one of Project

Sentinel's defining strengths

Months ago, you said something very important:

"The system must be extremely easy to use."

That single sentence has influenced almost every architectural decision.

Many enterprise security tools expose hundreds of pages, menus, and separate consoles.

Project Sentinel should instead allow a security manager to answer questions like:

- "Are my employees' computers healthy?"
- "Which mobile devices need attention?"
- "What changed since yesterday?"
- "What should we fix first?"

within a few clicks, while still allowing experienced analysts to inspect the underlying evidence, relationships, and timelines.

I believe that combination—**enterprise-scale visibility, evidence-based analysis, and a mission-driven user experience**—is one of the strongest differentiators we can realistically build into Project Sentinel.

====[USER]=====

Good and continue

====[ASSISTANT]=====

Excellent. I think we are now moving into the part of the blueprint that could make **Project Sentinel** truly unique in the market.

Until now we have designed a system that understands the cyber world.

Now I want it to understand the **organization**.

Most cybersecurity products know devices.

Very few understand the business.

Project Sentinel should.

PROJECT SENTINEL BLUEPRINT
